Prototype system for a
Copernicus CO₂ service

COCO2 PRESENTATION DAY

WP8 User Engagement

Glen Peters (CICERO), Roxana Petrescu (VU)
5/12/2022

Overview of deliverables (past and future)

- Budget Estimates for CO₂ and CH₄ for major emitters
 - D8.1 (December 2021), D8.2 (December 2022), D8.3 (December 2023)
- Decision Support Blueprint
 - D8.4 (December 2022), D8.5 (July 2023)
- Catalogue of Studies
 - D8.6 (December 2022)
- Engagement and Implementation Plan
 - D8.7 (December 2021), D8.8 (December 2023)
- Starting point is really the country level (UNFCCC, GST, etc)

D8.2 Fossil CO₂ Inventory-based

D8.2 Fossil CO₂ Inventory-based

D8.2 Fossil CO₂ Inventory-based

Coming changes: updates on data & figures, inclusion of uncertainty

D8.2 Fossil CO₂ observation-based

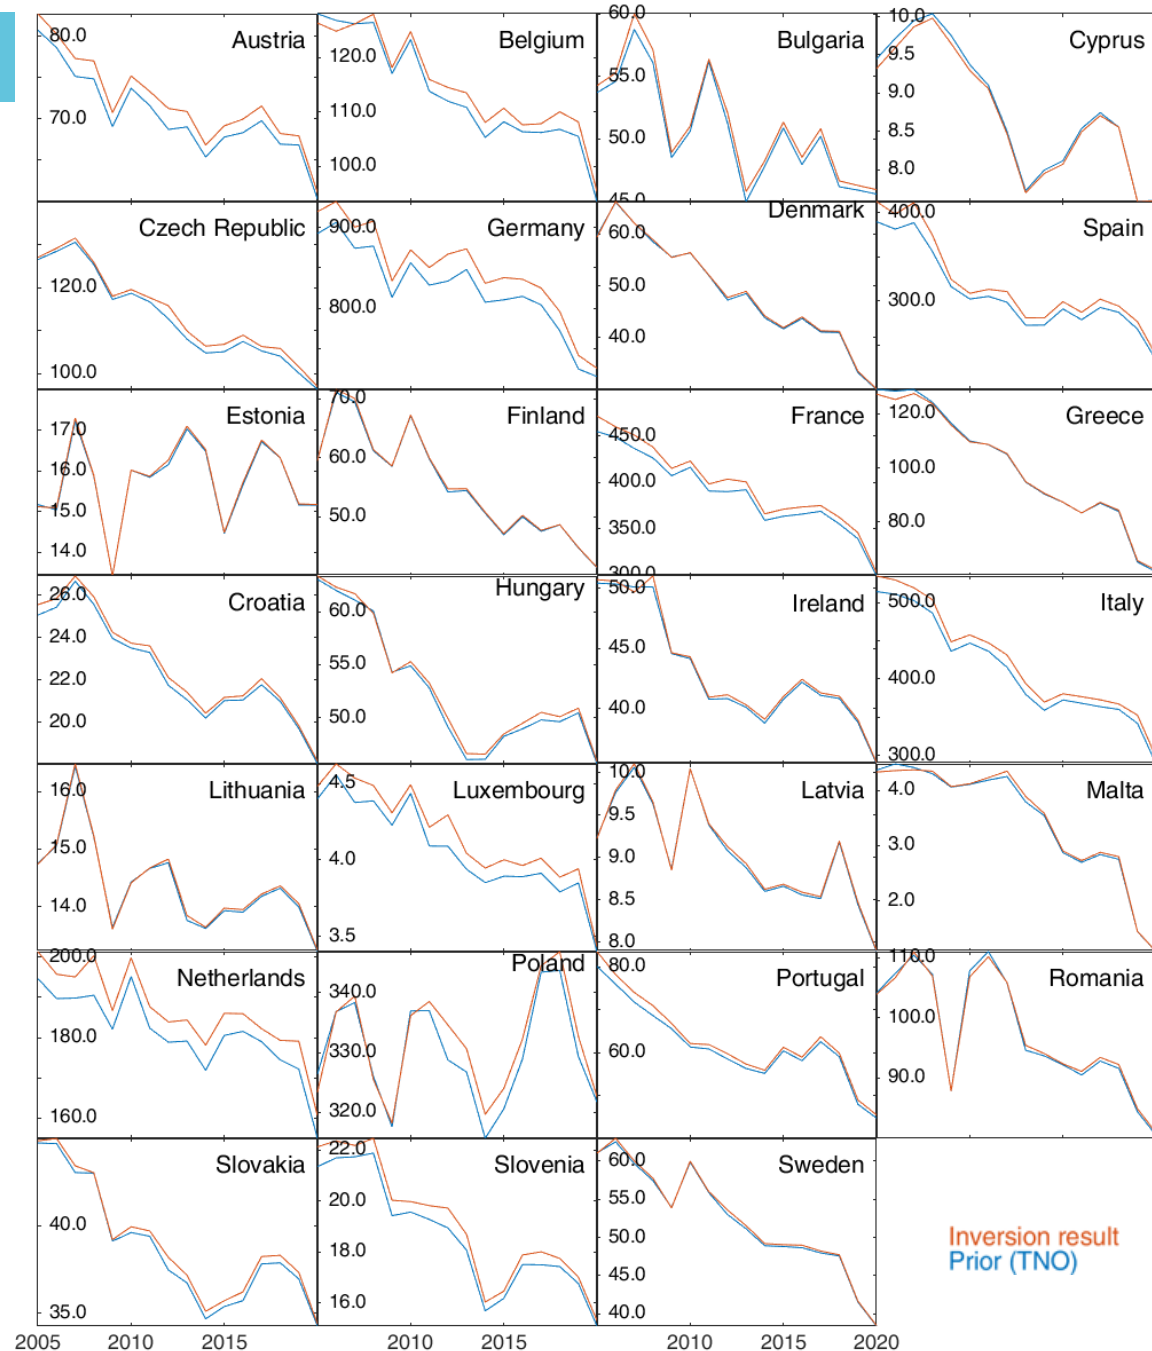

Current situation

- Prior: TNO (blue)
- Inversion: NO_x/CIF/CHIMERE
- Not really ready for broader circulation (to users)
- Can't communicate what is statistically significant
- Layer in better explanations of the status quo

Hopefully in the next 12 months:

- Uncertainty information
- Non-EU countries

D8.2 CO₂ Land Use

Current approach provides too much information with too little detail!

© OVERIFY project

Changes to come

- Inventory-based (UNFCCC, BLUE, Houghton, OSCAR, FAO)
 - Opens a discussion for Grassi type of definitional issues, etc
- DGVM (UNFCCC and individual DGVMs)
 - Opens for discussion of variability
- Observation based (UNFCCC & inversions)
 - Opens for a discussion of what is possible
- Potential change (maybe in 2023):
 - Inventory by activity (deforestation, afforestation, harvest, etc)

D8.2 CO₂ Land Use: Inventory-based comparisons

Splitting the analysis by the type of estimate helps comparisons

It remains hard to explain differences & definitions differ (managed land)

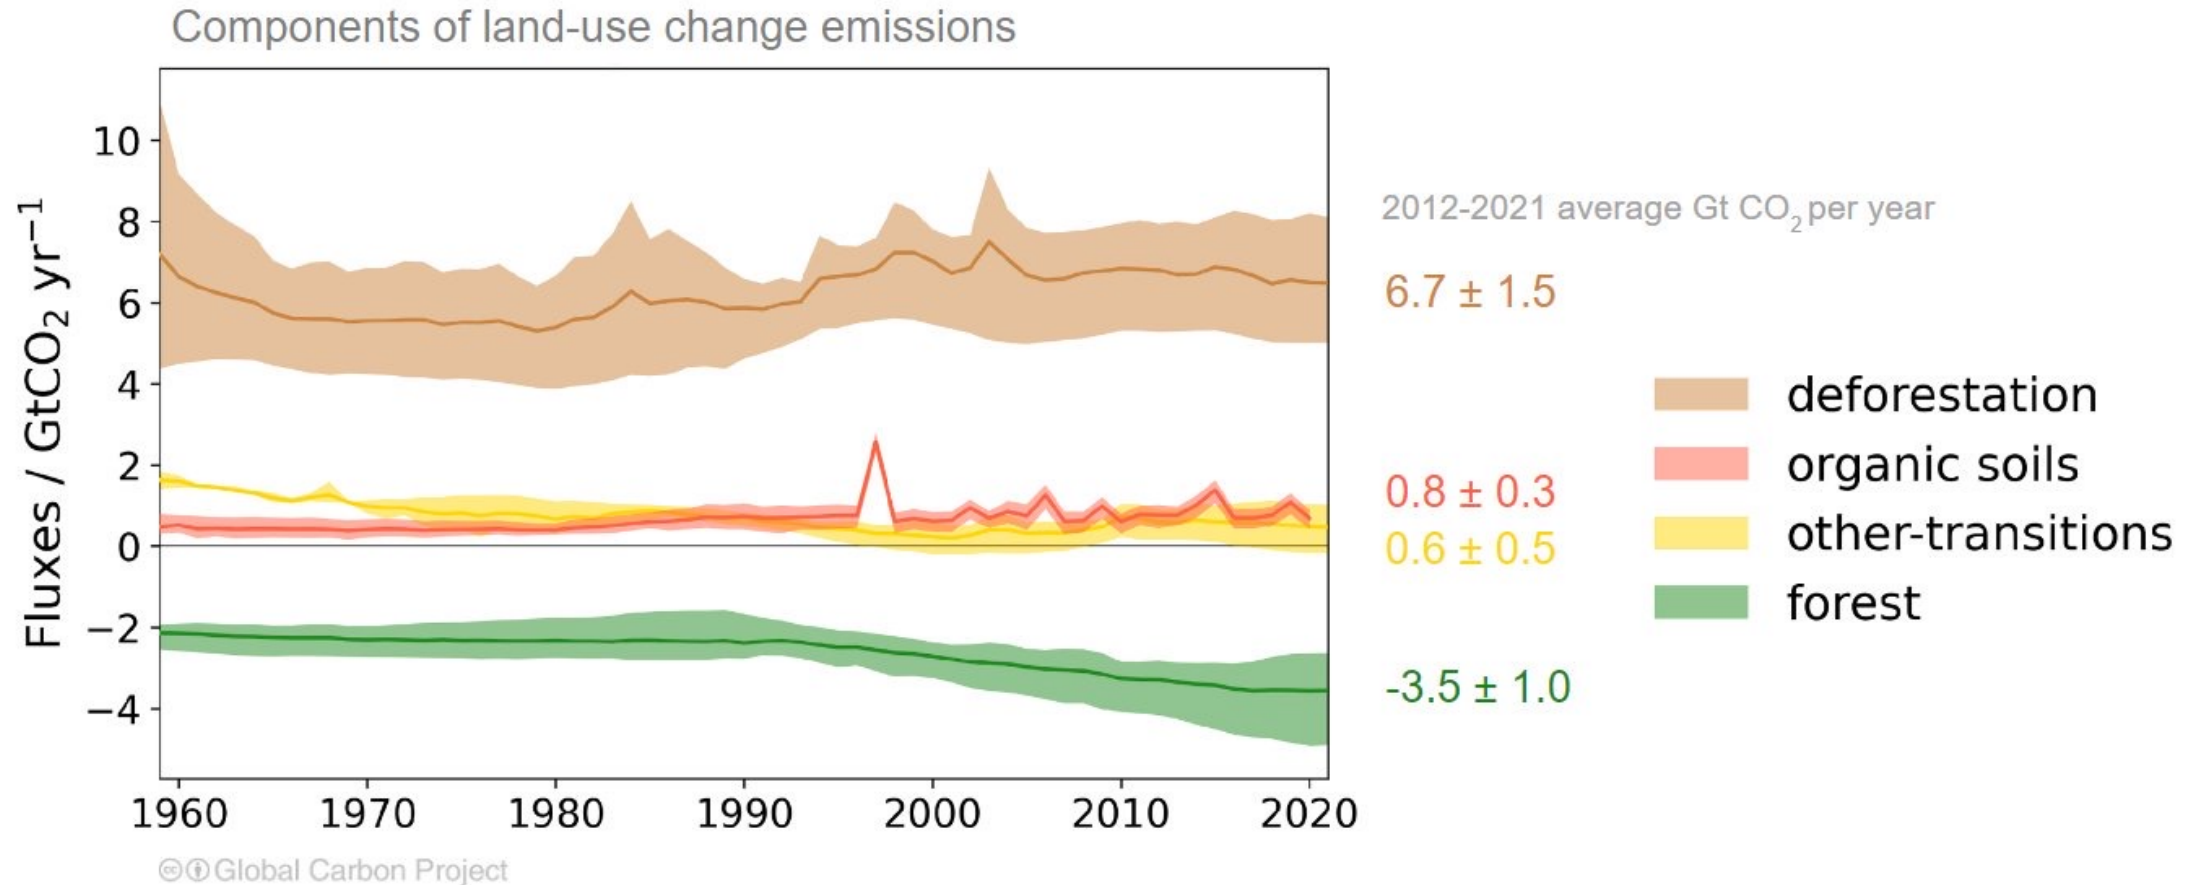

D8.2 CO₂ Land Use: Inventory-based comparisons

D8.2 CO₂ Land Use: Inventory-based comparisons

Potential change (2023) is to decompose country level estimates by component (global figure shown as an example)

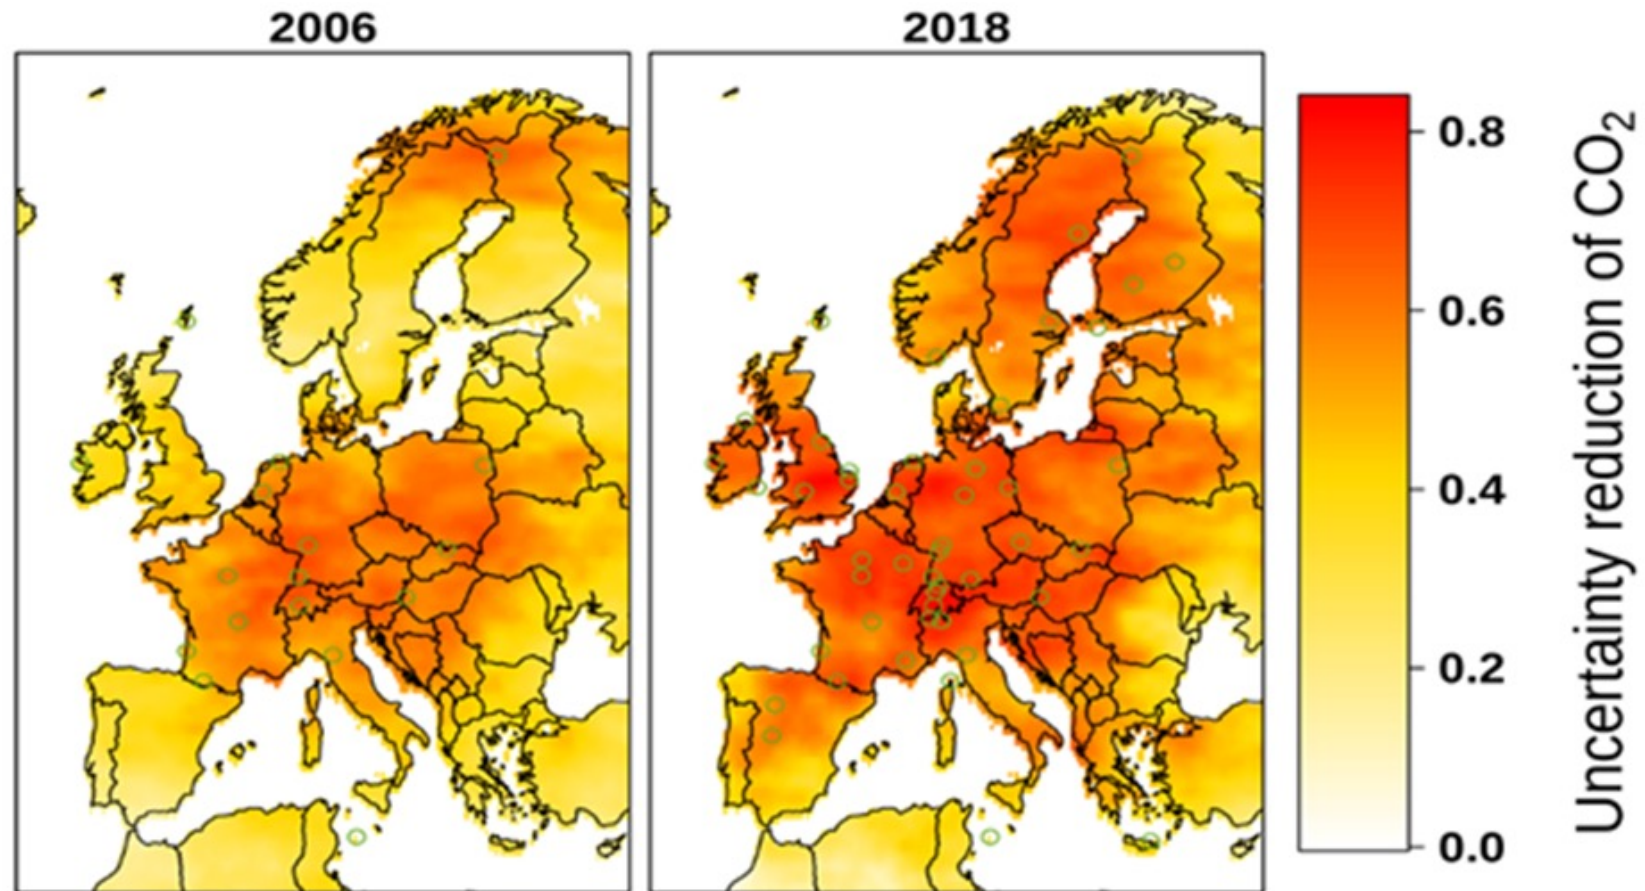

D8.2 Land-based CO₂ observation-based (inversions)

Uncertainty reduction maps: CarboScopeRegional: $(1 - \Delta_{\text{post}} / \Delta_{\text{prior}})$

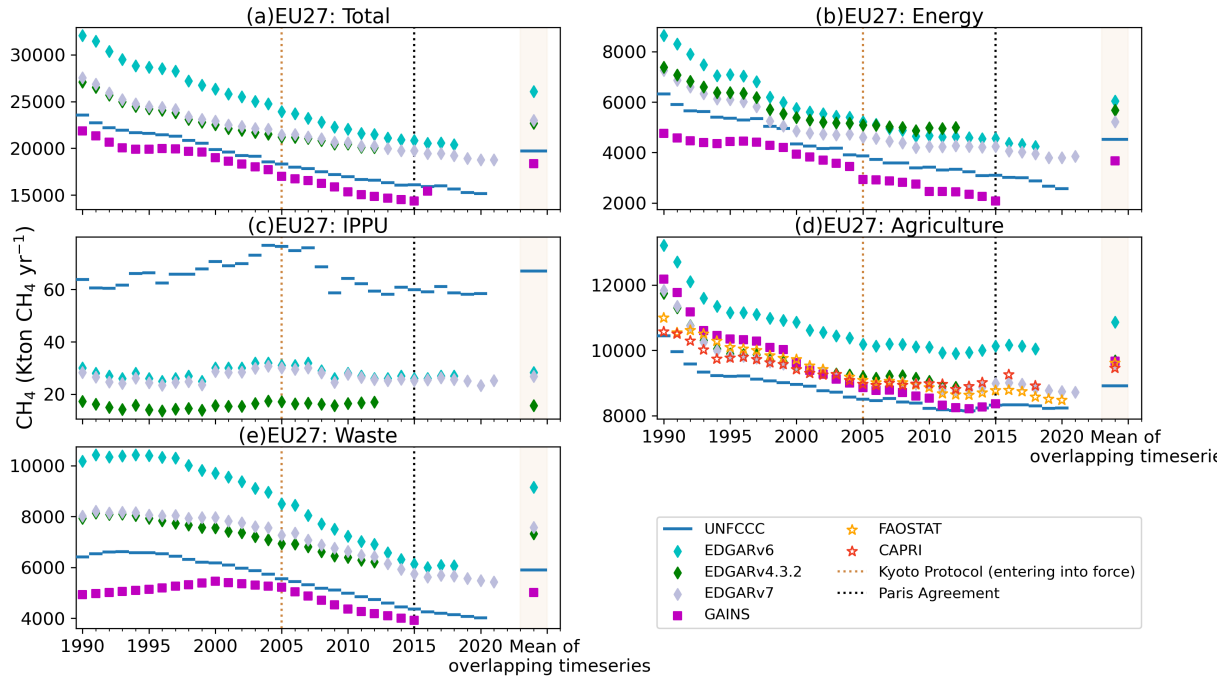

Uncertainty reduced with more observations (circles)

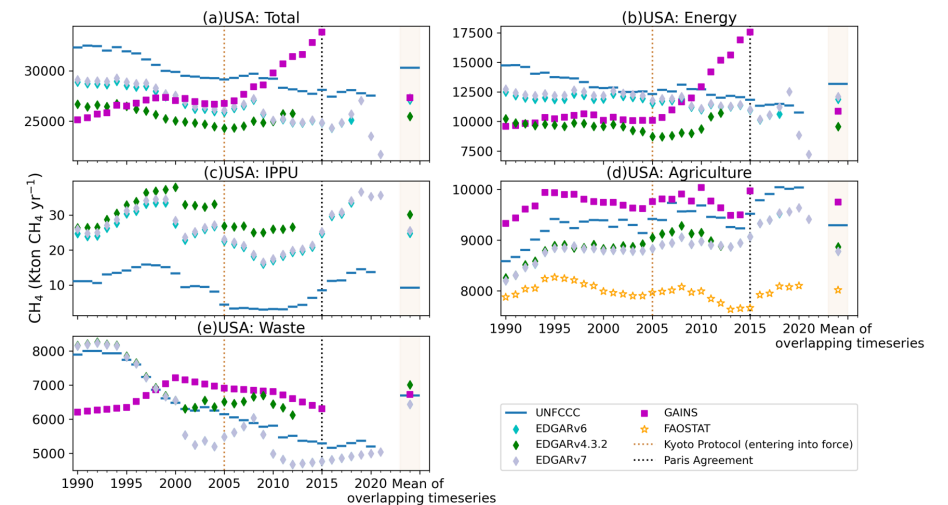

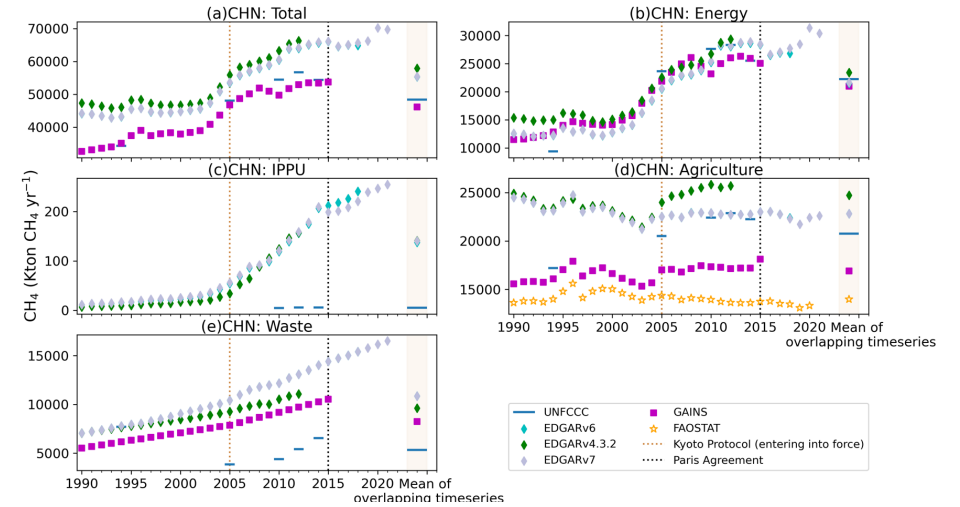

D8.2 Inventory-based CH₄ emissions

BU CH₄: updated times series and added EDGARv4.3.2 , v7 and CAPRI_Agr for (EU27)

Discrepancies due to application of different Tiers (1, sometimes 2 for EDGAR, FAO), country specific AD and EFs (GAINS).

USA FAO's Agriculture differences are due to the estimates of enteric fermentation (lower for FAO, cattle stocks differences due to timeframe of statistics ingestion).

D8.2 Observation-based CH₄ estimates (inversions)

TD CH₄: updated times series and added EDGARv4.3.2 and v7

Australia: Pretty good agreement across BU and with method 1* of inverse estimates

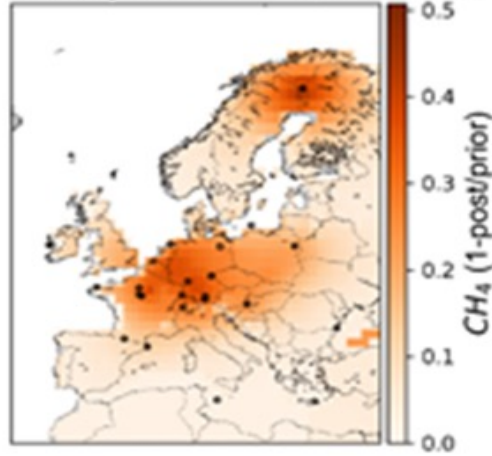

Europe: Trend of BU and UNFCCC seen by inversions. EDGARv6 higher estimates (we know that already!)

*Four methodologies were used to separate CH₄ anthropogenic emissions from inversions (Deng et al., 2022)

CH₄ Uncertainty reduction maps

2006 uncertainty reduction CH₄, VERIFY S4

2018 uncertainty reduction CH₄, VERIFY S4

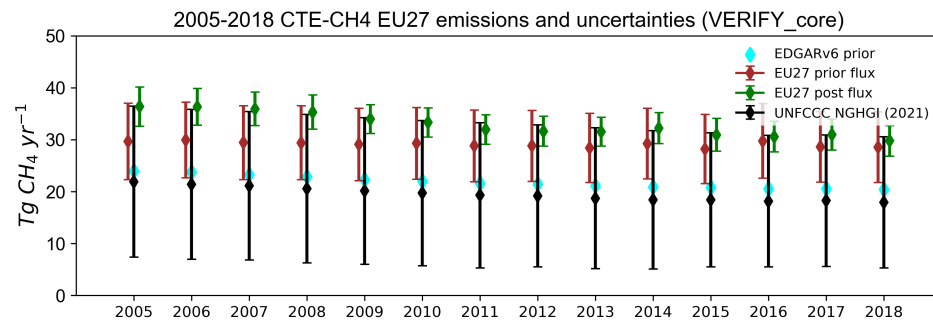

VERIFY_inclusive(S4) inversion run, uncertainty reduction maps computed as $(1 - \Delta_{post}/\Delta_{prior})$ for 2006 and 2018 with different sets of observation stations.

Uncertainties reduced with more observations (circles)

D8.2 Observation-based CH₄ estimates (inversions)

TD CH₄: analysis of prior/posterior fluxes and uncertainties

- Ongoing work to try to identify/explain differences due to the priors used by BU and TD systems
- UNFCCC uncertainty is (too) high
- We can't compare uncertainties between figures

Some reasons for differences in inverse systems:

1. uncertainty assigned to the observations (i.e. how much weight/trust we put)
2. differences between prior/obs are large (i.e. 'wrong' magnitude or distribution of prior emissions, or bad transport modelling)
3. prior emissions around the sites are simply very small, and therefore the inversion does not change fluxes much (i.e. prior flux uncertainty is small).

D8.4 Decision Support Blueprint

- Background
 - What is and why do we need a CO2MVS?
- Overview of the status quo
 - Background of verification (through UNFCCC) & inversions
 - Current inventory activities (from National Inventory Reports)
 - Summary of events: VERIFY workshops, IPCC Expert Meeting, etc...
 - Summary of main concerns so far
- Moving beyond the status quo
 - How to respond to better meet user needs
- First half 2023 – user engagement (D8.5 July 2023)

D8.6 Catalogue of published studies on hot-spot detection of CO₂/CH₄

Published studies on hot spot detection (CO₂, CH₄) - uMap (openstreetmap.fr)

The image displays the uMap interface for the CoCo2 project. The main map shows a world view with various hot spot markers. A legend on the left categorizes these markers by gas (CO₂ or CH₄) and source (General, Cities and clusters, Cities and regions, Natural events, Power plants, Agriculture, Landfills, Natural events, CH & gas, Plumes). A detailed view of the Kyger Creek Power Plants in the USA is shown, including a map of the area and a list of related studies. The studies list includes:

- City of Berlin and neighboring power stations, EU / CO₂
- City of Berlin, Germany, EU / CO₂ / power plants
- Czech Republic, EU / CO₂ / power plants
- Eastern Germany, EU / CO₂ / power plants
- Four Corners, CO₂ / Coal-fired power plants
- Gavin Power Plants, USA / CO₂ / power plants
- Ghent Generating Station, USA / CO₂ / power plants
- Independence, CO₂ / Coal-fired power plants
- Indianapolis, USA / CO₂ / power plants
- Intermountain, CO₂ / Coal-fired power plants
- Kyger Creek Power Plants, USA / CO₂ / power plants
- Los Angeles, CO₂ / Cities and clusters
- Martin Lake, CO₂ / Coal-fired power plants
- Matimba Babomba Power Station, Africa / CO₂ / power plants
- Matimba Babomba Power Station, CO₂ / Coal-fired power plants
- Monticello, CO₂ / Coal-fired power plants
- Navajo, CO₂ / Coal-fired power plants
- Poland, EU / CO₂ / power plants

Examples of published studies are available for visualization [here](#). It serves as good research examples and will stand as the scientific communication to inform a wide range of users (stakeholders, policy makers, local authorities) representing an educational link to fighting climate change.

Future work

- Budget Estimates for CO₂ and CH₄ for major emitters
 - Improvement of graphical presentation
 - Improvement in explanations
 - Understanding differences between estimates, requires 1-1 comparisons
- Decision Support Blueprint
 - First half of 2023 will be focused on user feedback and interaction
 - Workshops and involvement in ongoing events (WMO, inventory agencies, etc)
 - New version of blueprint in July 2023

THANK YOU
